

# Novatec 30 - Disc wheels: identification

9. febrúara 2017 9:48

1. Does your front wheel have hub XD611SB with threaded side caps or press-in side caps?  
Picture below is showing the difference between threaded and press-in type so that should help you identify your case:

2. Does your rear wheel have hub D942SB for standard QR or is it for 12x142mm through axle?
  - a. If it is for standard QR, please check which type of side cap is there on the drive side (cassette body side). It can be either side cap made of 2pcs or it can be 1pc side cap, like picture below shows:

- b. If it is for 12x142mm through axle (X12), please check which type of side cap is there on the drive side (cassette body side). It can be either side cap with simple cylindrical shape or a side cap also with cylindrical shape, but with small flange/skirt on it, like picture below shows:

3. Based on info above please answer the following 2 questions:  
1/ Do you have Threaded or Press-in type of front hub?  
2/ Do you have side cap like case 2.a. shows or is it case 2.b.?

This information helps us a lot in advising you on correct parts for your Novatec 30 Disc wheels.  
Thank you.
